ABSTRACT

Here I'm going to introduced about my Main project topic named "JOINME" is a concept of Virtual IT company. This is an extended version of this project to the mobile version developed using the cross-platform mobile development technology named REACT NATIVE. This mobile version of this project only for Company employees or the users. This technology is implement for the easy of use to the Users for get the their job availabilities at any time any where by using there mobile device. By using this technology either we can implement this project in ANDROID or iOS. Under this project any IT company can register by the authorization of admin, and post their available jobs. Any registered/unregistered user may view all job openings, but only registered user can request for that job. Each registered user is necessary to add well knowing programming skills, it will be sorted for their suitable job opportunity easily. Unlike normal job seeking project, this will automatically split the job to the available personnel and it will analyse to the registered company how more time and how much employees actually need to be completed. After getting the analysis they can post how much employees actually they want and the overall calculation of getting income and paying for employees or users.

TECHNOLOGIES USED

REACT NATIVE, JAVASCRIPT, JSON, PHP, MYSQL
